Hello World Paper

The code for this "Hello World" website was very simple to write. The first tag used is the <html> tag. This tag just identifies the overall page as being html. Next is the <head> tag, which holds the information for joining a CSS file for styling and the title that will appear at the top of the browser page. I used a simple "Hello World Website" title. After the <head> tag there is a <body> tag that contains all the information for the main part of the page, which, in this case, is just the words "Hello World." Though it's not necessary, I use the <text> tag inside the body tag. I spent many hours over the weekend learning how to use many HTML tags and learning CSS. I used w3schools.com as a reference for both, and created a much more complex website that I will turn in on Friday.
