Fancy Hello World
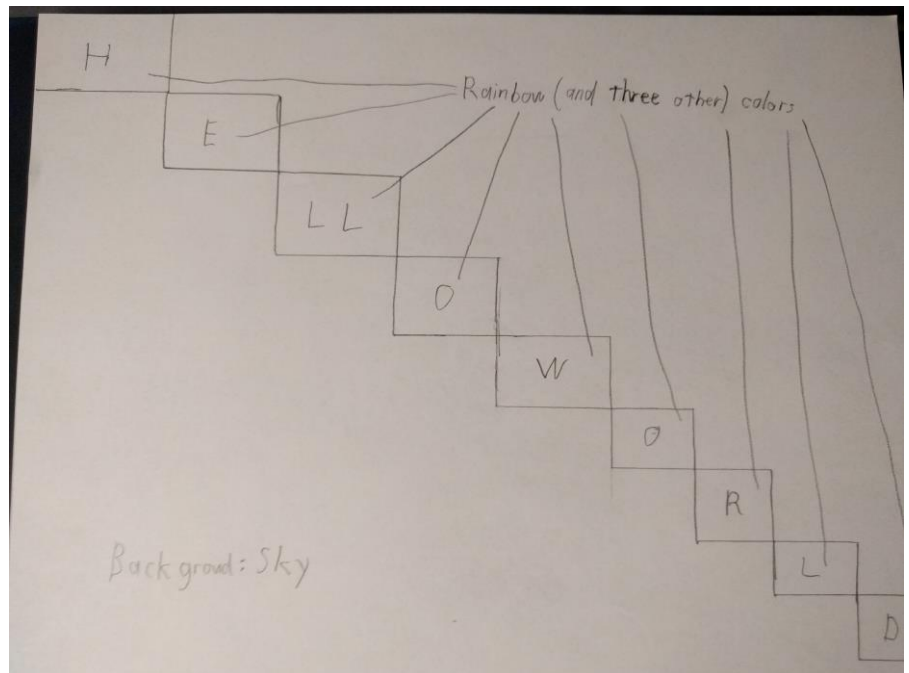

Steven Peters

For this assignment we were told to make a "fancy" Hello World web page. Essentially we needed to style a web page to look unique and interesting while still keeping the theme of "Hello World."

Since I already wrote a web page that was more functional then creative, I decided to be as creative as possible with this one, so I designed each letter to be inside a different color box. I decided to make the background a picture of perfectly blue sky. Each of the letters inside the boxes are also colored. The colors go in reverse directions, so the letters start with a red "H" and end with a purple "D", but the boxes start purple and end red. Since "Hello World" has more than six letters I had to put some mixtures of

colors like "orangered" and "yellowgreen" in the combination. In order to create the boxes, I put

paragraphs inside divisions and gave each div an id. Then I set each div to have its own text and background colors. To get each div the same size I coded any div to have a height and width of 10% and set the margins of the page to 0%. Then, for each div I specified a "top" and "left" parameter so that they would appear as steps.

While this web page may not be at all functional, it is a more "fun" web page just to play around with divs and paragraphs and the styling for them. If I was to add more to this web page I would try to figure out how to center the text in the box and possibly add a more interesting background, and add some form of functionality to the page.
